## **02 What is Logic?**

Instructor: W. M. Farmer

Revised: 14 September 2004

# What is Logic?

- Study of the principles of reasoning, particularly the notions of **valid inference** and **proof**.
- Branch of mathematics.
- Crucial distinction: the **syntax** versus the **semantics** of a language.
- Principal tools: formal systems called **logics**.

# What is a Logic?

- Informally, a logic is a system of reasoning.
- Formally, a **logic** is a family of **formal languages** with:
  1. A common syntax.
  2. A common semantics.
  3. A notion of **logical consequence**.
- A logic may include a **proof system** for **proving** that a given formula is a logical consequence of a given set of formulas.
- Examples:
  - Propositional logic.
  - First-order logic.
  - Simple type theory (higher-order logic).

# Language Syntax

- A language defines a collection of **expressions** formed from:
  - **Variables**.
  - **Constants** (nonlogical constants).
  - **Constructors** (logical constants).
- Two kinds of expressions:
  - **Terms**: Denote objects or values.
  - **Formulas**: Make assertions about objects or values.
- Some languages have constructors that bind variables (e.g.,  $\forall$ ,  $\exists$ ,  $\lambda$ ,  $I$ ,  $\epsilon$ ,  $\{ \mid \}$ ).

# Language Semantics

- A **model**  $M$  for a language  $L$  is a pair  $(D, V)$  where:
  1.  $D$  is a set of values called the **domain** that includes the truth values  $t$  and  $f$ .
  2.  $V$  is a function from the expressions of  $L$  to  $D$  called the **valuation function**.
- $M$  **satisfies** a formula  $A$  of  $L$ , written  $M \models A$ , if  $V(A) = t$ .
- $M$  **satisfies** a set  $\Sigma$  of formulas of  $L$ , written  $M \models \Sigma$ , if  $M$  satisfies each  $A \in \Sigma$ .
- $\Sigma$  is **satisfiable** if there exists some model for  $L$  that satisfies  $\Sigma$ .
- $A$  is **valid**, written  $\models A$ , if every model for  $L$  satisfies  $A$ .
- $A$  is a **logical consequence** of  $\Sigma$ , written  $\Sigma \models A$ , if every model for  $L$  that satisfies  $\Sigma$  also satisfies  $A$ .

# Hilbert-Style Proof System

- A **Hilbert-style proof system  $\mathbf{H}$**  for a language  $L$  consists of:
  1. A set of formulas of  $L$  called **logical axioms**.
  2. A set of **rules of inference**.
- A **proof** of  $A$  from  $\Sigma$  in  $\mathbf{H}$  is a finite sequence  $B_1, \dots, B_n$  of formulas of  $L$  with  $B_n = A$  such that each  $B_i$  is either a logical axiom, a member of  $\Sigma$ , or follows from earlier  $B_j$  by one of the rules of inference.
- $A$  is **provable** from  $\Sigma$  in  $\mathbf{H}$ , written  $\Sigma \vdash_{\mathbf{H}} A$ , if there is a proof of  $A$  from  $\Sigma$  in  $\mathbf{H}$ .
- $A$  is a **theorem** in  $\mathbf{H}$ , written  $\vdash_{\mathbf{H}} A$ , if  $A$  is provable from  $\emptyset$  in  $\mathbf{H}$ .
- $\Sigma$  is **consistent** in  $\mathbf{H}$  if not every formula is provable from  $\Sigma$  in  $\mathbf{H}$ .

# Kinds of Proof Systems

- Hilbert style.
- Symmetric sequent (Gentzen).
- Asymmetric sequent.
- Natural deduction (Quine, Fitch, Berry).
- Semantic tableaux (Beth, Hintikka).
- Resolution (J. Robinson).

# Soundness and Completeness

- Let  $\mathbf{P}$  be a proof system for a language  $L$ .

- $\mathbf{P}$  is sound if

$$\Sigma \vdash_{\mathbf{P}} A \text{ implies } \Sigma \models A$$

- $\mathbf{P}$  is complete if

$$\Sigma \models A \text{ implies } \Sigma \vdash_{\mathbf{P}} A$$

# Theories

- A **theory** is a pair  $T = (L, \Gamma)$  where:
  1.  $L$  is a language (the **language** of  $T$ ).
  2.  $\Gamma$  is a set of formulas of  $L$  (the **axioms** of  $T$ ).
- $M$  is a **model** of  $T$ , written  $M \models T$ , if  $M \models \Gamma$ .
- $A$  is **valid** in  $T$ , written  $T \models A$ , if  $\Gamma \models A$ .
- $A$  is a **theorem** of  $T$  in  $\mathbf{P}$ , written  $T \vdash_{\mathbf{P}} A$ , if  $\Gamma \vdash_{\mathbf{P}} A$ .
- $T$  is **satisfiable** if  $\Gamma$  is satisfiable.
- $T$  is **consistent** in  $\mathbf{P}$  if  $\Gamma$  is consistent in  $\mathbf{P}$ .
